Nitriding is a heat treating process that diffuses nitrogen into the surface of a metal to create a case-hardened surface. These processes are most commonly used on low-alloy steels. They are also used on titanium, aluminium and molybdenum. Typical applications include gears, crankshafts, camshafts, cam followers, valve parts, extruder screws, die-casting tools, forging dies, extrusion dies ...

Energy conservation is the effort made to reduce the consumption of energy by using less of an energy service. This can be achieved either by using energy more efficiently (using less energy for a constant service) or by reducing the amount of service used (for example, by driving less). Energy conservation is a part of the concept of Eco-sufficiency. ...

Each complete antibody has two antigen-binding pockets, located in the F V regions, and can bind to two antigens (bivalent binding). However, if the two antigens are too close ( $\leq 3$  nm), or too far apart ( $\geq 29$  nm), the antibody can only bind to one antigen (monovalent binding) []. There is a significant affinity change between monovalent and bivalent bindings with a 1,500-fold change in  $K_d$  ...

This paper evidences the viability of chemical recycling of CO<sub>2</sub> via reverse water-gas shift reaction using advanced heterogeneous catalysts. In particular, we have developed a multicomponent Fe-Cu-Cs/Al<sub>2</sub>O<sub>3</sub> catalyst able to reach high levels of CO<sub>2</sub> conversions and complete selectivity to CO at various reaction conditions (temperature and space velocities).
