The optic sulci (grooves) are the first parts of the eye to develop at the cranial pole of the embryo. Protrusion of the optic grooves coincides with embryonic folding, as the edges of the neural folds begin to come together. As they continue to grow outward from the primitive diencephalon, the optic grooves form the optic vesicles, which is continuous with the forebrain cavity.

Anatomy and physiology are two related biology disciplines.Many college courses teach them together, so it's easy to be confused about the difference between them. Simply put, anatomy is the study of the structure and identity of body parts, while physiology is the study of how these parts function and relate to one another.

### Difference Between Anatomy and Physiology

Microscopic anatomy is further divided into the exploration of the histological and cytological studies. Cytology is the branch of microscopic anatomy that studies the cells and histology is the branch of microscopic anatomy that studies tissues. From the smallest to the largest part of the human anatomy, in that sequential order, are the: Cells
